Basic computer hardware

Tasks

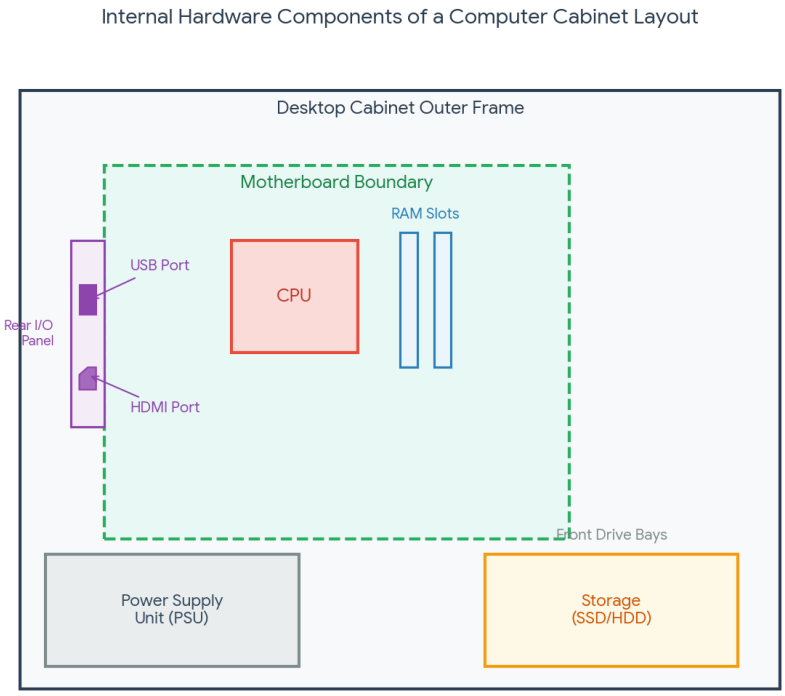

1. Open your computer or laptop and take a clear photo or screenshot of the System Information or About page that shows your processor (CPU), RAM, and storage details.

Ans.:-

2. Draw and label a diagram (on paper or digitally) showing the main hardware components inside a computer cabinet, including CPU, RAM, motherboard, hard drive/SSD, power supply, and at least two ports (USB, HDMI, etc.).

Ans.:-

**3. List the hardware components you would check or upgrade to make your laptop run faster for gaming or video editing, and explain in one line why each upgrade helps.

Hint: Think about RAM, SSD, GPU, and cooling.**

Ans.:-

Hardware Component	Why it helps
RAM	More RAM allows games and video-editing software to run smoothly without slowing down.
SSD	A faster SSD improves Windows boot time, game loading, and file-transfer speed.
GPU (Graphics Card)	A better GPU improves gaming FPS and speeds up video rendering and effects.
Cooling System	Better cooling prevents overheating and helps the CPU/GPU maintain high performance.
CPU (Processor)	A faster CPU improves game performance, multitasking, and video-editing/rendering speed.

4. Research the difference between SSD and HDD storage, then write a short comparison (3 points) explaining which one is better for a student who wants fast boot times and why.

Ans.:-

Point	SSD	HDD
1. Speed	Much faster boot and application loading.	Slower boot and loading times.
2. Performance	Gives faster file transfer and better overall system responsiveness.	Slower because it uses spinning disks.
3. Durability	No moving parts, so it is more resistant to physical shocks.	Has moving parts, so it can be more sensitive to drops and vibration.
4. Noise	Silent operation.	Can make spinning or clicking sounds.
5. Power	Usually uses less power, which can help laptop battery life.	Usually uses more power.
